

2A. Cropping and Resizing Dog Images from XML Annotations

Using XML Processing and PIL

This code snippet demonstrates how to extract bounding box information from XML annotation files, crop images of dogs from a specified directory using these bounding boxes, and resize each cropped image to 128×128 pixels. The cropped images are saved in a designated output directory.

2B. Feature Extraction: Edge Histogram and Similarity Measurements

This section describes how to extract features from cropped dog images and measure their similarity.

1. **Select Images:** Choose one image from each class.
2. **Convert to Grayscale:** Change the color images to grayscale.
3. **Calculate Edge Angles:** Use Sobel filters to find the edge direction for each pixel:
4. **Compare Histograms:** Measure similarity between the first two images using Euclidean, Manhattan, and Cosine distances.

2C. Histogram of Oriented Gradient (HOG) Feature Descriptor

In this section, we computed and visualized the HOG descriptors for a selected image.

Steps:

1. **Select an Image:** Choose one image from your dataset.
2. **Compute HOG Descriptors:**
 - Use a function to load the image and convert it to grayscale.
 - Compute the HOG features and generate the HOG image.
 - Visualize both the original grayscale image and the HOG descriptor side by side.
3. **Visualization:** The original image will be displayed alongside its HOG descriptor, allowing for a visual comparison of the features captured by the HOG method.

For more information about HOG, refer to the [Wikipedia page on HOG](#) and the [scikit-image documentation](#).

2D. Dimensionality Reduction using Principal Component Analysis (PCA)

In this section, we performed dimensionality reduction on edge histograms obtained from images of four different classes using Principal Component Analysis (PCA).

Steps:

1. **Select Images:** Use images from all four classes in your dataset.
2. **Convert to Edge Histograms:**
 - Convert all images from the four classes into edge histograms, which capture the distribution of edges in the images.
3. **Perform PCA:**
 - Apply PCA to the set of histograms to reduce their dimensionality from 36 dimensions to 2 dimensions.
 - Note that during this step, class labels will not be used.
4. **Plot Results:**
 - Visualize the reduced 2D points on a scatter plot.
 - Use different colors to represent the different classes, allowing for a visual assessment of class separability in the reduced feature space.

For more details on PCA, you can refer to the [scikit-learn PCA documentation](#) and a code example using the Iris dataset can be found [here](#).

4 Feature Extraction from Tweets

We will use `CountVectorizer` and `TfidfVectorizer` from Scikit-learn to analyze the tweet dataset.

What We Will Do

1. **CountVectorizer**: Count how many times each word appears in the tweets.
2. **TfidfVectorizer**: Calculate the importance of each word in the tweets.

Results

We will check the size of the two feature sets we created.

```

5 Dimensionality Reduction and Visualization of Tweet Classes

Selected Classes

For this analysis, we will pick the following four classes that are expected to be separable:

1. Anger
2. Joy
3. Fear
4. Trust

Dimensionality Reduction

We will perform dimensionality reduction on both the token count features and TF-IDF features, reducing them to 2 dimensions.

Visualization

We will create two separate plots:

1. **Token Count Features:** Plot the 2D points using four different colors for the selected classes.
2. **TF-IDF Features:** Plot the 2D points using four different colors for the selected classes.

Observations

After plotting, we will analyze how many classes are visually separable (i.e., non-overlapping) in both plots.
